

# Fitness and Diet Tracker

**Group 14**

Baldeep Dhada | Christopher Mulya

# Introduction

## Sub-Package 1 Module 1 (warmup.py)

- The WarmUp class is responsible for creating a personalized warm up routine based on the users preferred workout type
- Each method in this class returns a warmup routine that has to be performed before beginning the workout
- This module is important because warming up before working out decreases the risk of injury

# Functions

## “athlete”

The athlete function returns warmups associated with athletes such as **jogging, jumping jacks, and stretches**.

## “strength”

The strength function returns warmups associated with strength training such as **light weight curls, light shoulder presses and body weight squats**

## “body\_weight”

The body weight function returns warmups associated with body weight exercises such as **incline push ups, body weight squats, and stretches**

## Sub-Package 1 Module 2 (workout.py)

- The workout module is responsible for creating a full body workout routine according to the users preferred workout style
- The user has a choice of selecting for the amount of time they are going to spend working out (0-30 min, 30-45 min, 45-60 min)
- This module also provides the user with youtube video links as a guide so the exercise can be done correctly and safely

# Functions

## **“athlete”**

The athlete function returns workouts associated with speed/intensity such as plyometrics, conditioning, and push pressing

## **“strength”**

The strength function returns workouts associated with power lifting such as bench press, barbell squats, and deadlifts

## **“body\_weight”**

The body\_weight function returns workouts associated with calisthenics such as push ups, pistol squats, and pull ups

# Sub-Package 2 Module 1

- "planoptions.py" serves as a module within the fitness\_diet\_tracker package with the primary purpose of aiding fitness planning.
- The included "PlanOptions" class offers functions to calculate Body Mass Index (BMI), determine Total Daily Energy Expenditure (TDEE), and adjust user's caloric intake.
- This module plays a crucial role in providing foundational calculations for personalized fitness and diet plans.

# Functions

**“calculate\_bmi”**

Calculates the **Body Mass Index (BMI)** for both males and females.

**“calculate\_tdee”**

Computes the **Total Daily Energy Expenditure (TDEE)** by multiplying the calculated BMI with the activity level multiplier.

**“calculate\_target\_cal”**

Adjusts caloric intake by **adding or subtracting** the necessary **calories** based on the user's chosen weight goal, whether it's gain or loss.

# Sub-Package 2 Module 2

- "Dietoptions.py" is a module within the fitness\_diet\_tracker package, featuring the "DietOptions" class inheriting from the "PlanOptions" superclass.
- Its core function is to generate personalized meal plans based on user dietary preferences.
- The module includes specific functions for generating meal plans tailored to vegan, vegetarian, or meat-based diets, offering users a comprehensive and integrated approach to fitness and nutrition.

# Functions

`“generate_vegan_meal”`

**Generates** a personalized **meal plan** tailored for individuals following a **vegan** diet.

`“generate_vegetarian_meal”`

**Generates** a personalized **meal plan** tailored for individuals following a **vegetarian** diet.

`“generate_meat_meal”`

**Generates** a customized **meal plan** suitable for individuals with a preference for a **meat-based** diet.
